

USER MANUAL

# M550 Pro

German edition

**AZDOME**

M550 PRO

# 01

## Welcome

---

Thank you for choosing the AZDOME M550 Pro. This guide walks you through unpacking, mounting, pairing, and getting the most out of your camera. We've built this manual for skim-reading: every section is short, every step numbered.

# 02

## What's in the box

---

1. Front camera unit
2. Rear/cabin camera (where applicable)
3. 3M adhesive mounts (x2)
4. Type-C power cable (3.5m)
5. Trim removal tool
6. 64GB high-endurance microSD card (pre-formatted)
7. Alcohol wipe for windshield prep
8. Quick-Start guide (this document)

# 03

## Mounting position

---

Mount the front camera centered just below the rearview mirror -- this gives you the widest, least-obstructed view. For rear cameras, mount near the top of the rear windshield, centered. Clean the glass with the included alcohol wipe before applying the 3M mount.

# 04

## Installation

---

1. Peel the 3M backing and press the mount firmly for 30 seconds.
2. Let the adhesive cure for 5 minutes before attaching the camera.
3. Route the Type-C cable along the headliner, down the A-pillar, and under the dashboard.
4. Plug into your 12V port (or hardwire kit for 24h parking mode).
5. Start your car -- the camera boots in under 3 seconds.

# 05

## Wi-Fi pairing

---

1. Open the AZDOME app on your phone.
2. Tap "+ Add device" -> select your model.
3. The app will prompt you to join the camera's Wi-Fi (5GHz, password printed on the camera body).
4. Once paired, all settings live in the app and survive firmware updates.

# 06

## Voice control

---

While recording, the camera listens for three commands:

- "Lock Video" -- protects the current clip from being overwritten.
- "Take Photo" -- saves a still to the SD card.
- "Turn on WiFi" -- enables Wi-Fi for app pairing.

Disable voice control any time in Settings -> Audio.

# 07

## Parking mode

---

Parking mode requires the optional Hardwire Kit. Once installed:

- Choose between Collision Detection (low-power) or 24h Time-Lapse (continuous).
- The kit's low-voltage cutoff protects your battery (default 11.8V).
- Adjust the cutoff in Settings -> Power if your battery is older.
